Step by step

~10 minutes
One-time setup

Sepolia testnet
Nothing real at risk

October 2026
Edition

How CommitX works

You put a small stake behind a goal. Each period you prove you did the work, and your cohort checks it. At the end, the smart contract pays everyone back based on how consistently they showed up — people who hit the target also split what the others forfeited.

01

Commit

Pick a goal and how often you'll prove it.

02

Stake

Lock test ETH in the contract.

03

Prove

Post a link every period.

04

Verify

Peers approve each proof.

05

Withdraw

Pull your payout to your wallet.

CONTENTS

PART 1 — GET SET UP

01	Before you start	1 min
02	Install MetaMask	2 min
03	Create your wallet	3 min
04	Switch to the Sepolia test network	1 min
05	Get free test ETH	2 min

PART 2 — USE COMMITX

06	Connect to CommitX	1 min
07	Join or create a challenge	2 min
08	Prove your progress	Each period
09	Settle & withdraw your payout	1 min

REFERENCE

- [Troubleshooting](#)
- [Glossary](#)

Safety first. CommitX will never ask for your recovery phrase or private key. Only approve wallet requests that you started yourself.

01

GET SET UP • 1 MIN

Before you start

CommitX lets you put a small amount of ETH behind a goal. To take part you need a crypto wallet (MetaMask) and some free test ETH. Everything happens on **Sepolia**, a practice network — the ETH there has no real-world value, so you can learn without risk.

- 1 A computer with **Chrome, Brave, Edge or Firefox**.
- 2 About **10 minutes** for the one-time setup.
- 3 A pen and paper to write down your wallet's recovery phrase.

TIP

You never send money to CommitX itself. Your stake goes into a public smart contract, and only you can withdraw your payout.

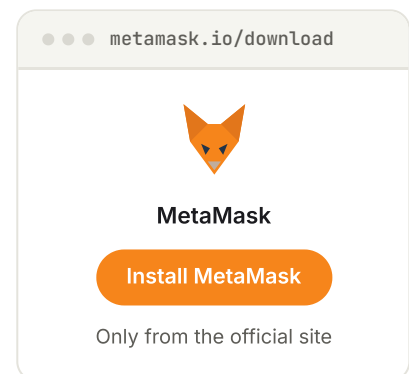

02

GET SET UP • 2 MIN

Install MetaMask

MetaMask is a free browser extension that holds your wallet and asks your permission before anything is signed or sent.

- 1 Go to **metamask.io/download** — type it yourself rather than clicking ads or search results.
- 2 Choose your browser and click **Install MetaMask** (or **Add to Chrome**).
- 3 Click **Add extension** in the browser prompt.
- 4 Pin it: click the puzzle-piece icon in your toolbar and pin the **fox** so it's always one click away.

metamask.io/download

<https://metamask.io/download/>

IMPORTANT

Fake MetaMask sites and extensions exist. Only install from metamask.io, and check the publisher is MetaMask.

03

GET SET UP • 3 MIN

Create your wallet

Your wallet is protected by a **Secret Recovery Phrase** — 12 words that can restore it on any device. Whoever has these words owns the wallet.

- 1 Open MetaMask and choose **Create a new wallet**. Accept the terms.
- 2 Set a **password**. This only unlocks MetaMask on this computer.
- 3 Choose **Secure my wallet** and reveal your 12-word **Secret Recovery Phrase**.
- 4 Write the words on paper, **in order**. Keep it somewhere safe and offline.
- 5 Confirm by filling in the missing words. Your wallet is ready.

IMPORTANT

Never type your recovery phrase into a website, never screenshot it, and never share it — not with CommitX, not with MetaMask “support”. No real service will ever ask for it.

04

GET SET UP • 1 MIN

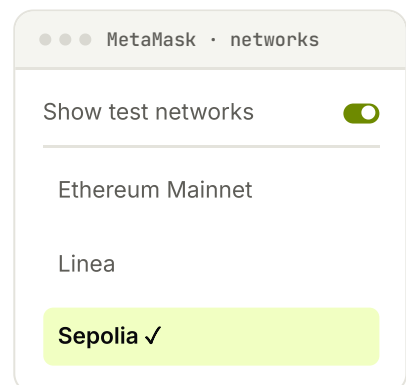

Switch to the Sepolia test network

CommitX runs on Sepolia. The quickest way: let CommitX switch for you.

- 1 **Easiest:** open CommitX. If your wallet is on the wrong network you'll see a yellow banner — click **Switch network** and approve in MetaMask.
- 2 **Manually:** open MetaMask, click the **network menu** at the top-left, turn on **Show test networks**, then pick **Sepolia**.

TIP

MetaMask's layout changes between versions, so labels may differ slightly. Look for the network selector near the top of the window.

05

GET SET UP • 2 MIN

Get free test ETH

A **faucet** is a website that gives out free Sepolia ETH. You need enough for your stake plus a little for **gas** (network fees, usually well under 0.005 ETH per action).

- 1 In MetaMask, click your account address at the top to **copy** it (it starts with 0x).
- 2 Open one of the faucets below and paste your address.
- 3 Complete the faucet's check and request ETH. It usually arrives within a minute.
- 4 Check MetaMask — your Sepolia balance should go up.

Google Cloud Web3 faucet

<https://cloud.google.com/application/web3/faucet/ethereum/sepolia>

Alchemy Sepolia faucet

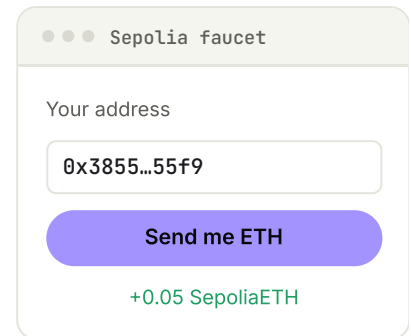

<https://www.alchemy.com/faucets/ethereum-sepolia>

Infura Sepolia faucet

<https://www.infura.io/faucet/sepolia>

TIP

Some faucets ask you to sign in or have a small balance on the main Ethereum network. If one doesn't work, try another.

06

USE COMMITX • 1 MIN

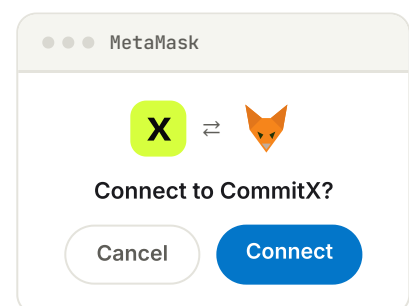

Connect to CommitX

Sign in so your progress is saved, then link your wallet so you can stake and get paid.

- 1 Click **Sign in** (top-right) and continue with Google — or use the demo account to look around.
- 2 Click **Connect wallet**. In the MetaMask popup, pick your account and click **Connect**.
- 3 Click **Sign to link MetaMask**. This signature is free and doesn't send a transaction.

TIP

The Learn page has a live checklist that tells you exactly which step you're missing.

07

USE COMMITX • 2 MIN

Join or create a challenge

Every challenge has a stake, a start and end time, a proof frequency and a qualification threshold.

- 1 Open **Explore** and pick a challenge. Read what counts as proof before you join.
- 2 Click **Stake & join**. MetaMask shows the stake plus the gas fee — click **Confirm**. A **0.125% joining fee** comes out of your stake and isn't refunded.
- 3 Or click **New challenge** and follow the five steps: basics, schedule, stakes, people and launch.
- 4 Joining closes when the challenge starts, and challenges can't be cancelled. If fewer than **2 people** join, the challenge can't run — you take your stake back minus the 0.125% fee.

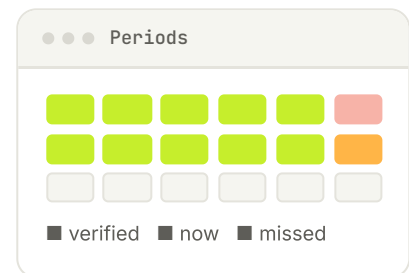

08

USE COMMITX • EACH PERIOD

Prove your progress

The challenge is split into **periods** (for example one per day). Submit proof once per period, then help review your cohort.

- 1 Open the challenge and go to **Submit proof**. Paste a link — a GitHub commit, a Strava run, a photo or doc — and add a short note.
- 2 Go to **Verify** → **Needs my vote** and review other people's proof. Approve it if it meets the rules; reject it if it doesn't.
- 3 A proof counts once about **a third of the cohort** approves it. You can't vote on your own proof.

TIP

Every verified period keeps a slice of your stake. Missing a period sends that slice to the shared penalty pool.

09

USE COMMITX · 1 MIN

Settle & withdraw your payout

When the end date passes, the challenge is settled on-chain and each person pulls their own payout.

- 1 Open the challenge after it ends. If it isn't settled yet, click **Settle & unlock payouts** — anyone in the challenge can do this.
- 2 Once settled, a **Payout ready** card appears. Click **Withdraw to wallet** and confirm in MetaMask.
- 3 You can also withdraw everything from **Dashboard** → **Ready to withdraw**.

Payout ready to withdraw

0.0625 ETH**Withdraw to wallet**

TIP

Your payout = the share of your stake you kept (stake after the 0.125% fee × verified periods ÷ total periods) + a share of the penalty pool if you reached the qualification threshold.

How your payout is calculated

joining fee	0.125% of stake (non-refundable)
kept	$(\text{stake} - \text{fee}) \times \text{verified periods} \div \text{total periods}$
bonus	$\text{penalty pool} \times \text{your periods} \div \text{all qualifiers' periods}$
payout	kept + bonus

You only get the bonus if you reach the qualification threshold. If nobody qualifies, everyone still keeps what they earned and the pool goes to the treasury.

REFERENCE

Troubleshooting

I see a “wrong network” banner.

Click **Switch network** in the banner and approve it in MetaMask. CommitX only works on Sepolia.

MetaMask says “insufficient funds”.

You need the stake **plus** a bit extra for gas. Get more Sepolia ETH from a faucet and try again.

The MetaMask popup didn't appear.

Click the fox icon in your toolbar — the request may be waiting there. Also check your browser isn't blocking popups.

My transaction has been pending for ages.

Sepolia is sometimes slow. Give it a few minutes. In MetaMask's Activity tab you can choose **Speed up**.

I can't see a Withdraw button.

The challenge must be settled first — click **Settle & unlock payouts**. Also make sure MetaMask is on the same account you joined with, then press the refresh icon on **Your position**.

I clicked Reject in MetaMask by accident.

Nothing happened and nothing was spent. Just click the button in CommitX again.

I lost my recovery phrase.

If you're still logged in to MetaMask, reveal and write it down now (Settings → Security & privacy). If you've lost both, nobody can recover the wallet — which is why it must be written down.

Is this real money?

No. Sepolia ETH is test currency with no value. It's the safe way to try CommitX.

REFERENCE

Glossary

Wallet

An app (like MetaMask) that holds your keys and approves transactions.

Address

Your public account number, starting with 0x. Safe to share.

Recovery phrase

12 secret words that restore your wallet. Never share it.

Sepolia

An Ethereum test network. Its ETH is free and worthless.

Gas

A small network fee paid for every transaction.

Stake

The ETH you lock into a challenge. A 0.125% joining fee comes out of it.

Period

One proof window, e.g. a day. The challenge has a fixed number of them.

Threshold

The % of periods you must complete to share the penalty pool.

Penalty pool

Stake forfeited by missed periods, shared among qualifiers.

Settlement

The on-chain step that fixes everyone's payout after the end date.

Withdraw

Pulling your payout from the contract to your wallet.

You're ready.

Open CommitX, head to **Explore**, and join your first challenge. The same guide lives on the **Learn** page, with a live checklist that shows what's left to set up.
